Planning, design and R&D systematic rearing facilities

Our company uses sex reverse of fish *Oreochromis niloticus*, breeding systems, progeny testing to establish the base stock.

From the base stock by using family selection, sex reverse and combined with genetic testing, the super male tilapia strain (sex chromosome YY) was built, then by crossing this super male tilapia strain with normal female (sex chromosome XX) to produce a particularly high rate of male Offspring (XY) for commercial use, named "SD tilapia."

The male ratio of SD tilapia is up to 95%, so there is no use of male hormone or other drugs. In addition, SD tilapia is large size, fast-growing, heavy fillet, low feed conversion rates, and excellent resistance to disease, etc., better than rest strains.

The tilapia you eat in Taiwan, most are from Sheng-Diao Aquatic Technology! With the experience of nearly 20 years, Huang Cheng-Xian breeds about 50 million fish fry every year, which not only supply Taiwan fish farms but also exported to China, Thailand, Malaysia and other countries.

Sheng-Diao Aquatic Technology of Taiwan, SDAT was established in 1978, and in foot of Dawu Mountain, Xinpi, Pingtung County. The two major items for business are

- (1) Selection of high quality tilapia strains: Taiwan tilapia (*Oreochromis niloticus*) and Taiwan red tilapia (*Oreochromis* spp.) brooder stock and commercial fish production

- (2) Planning systematic rearing facilities, design, R&D.

In 2012, we built "SD tilapia" strains. The male ratio of SD tilapia is up to 95%.

There is no use of male hormone or other drugs. In addition, SD tilapia is large size, fast-growing, heavy fillet, low feed conversion rates, and excellent resistance to disease, etc., better than rest strains.
